HR MARITIME BRINGS AI ON BOARD

WITH A CCTV UPGRADE
THAT TRANSFORMS
SECURITY ON AND
BEYOND HRA WATERS

HR MARITIME (HRM), IN PARTNERSHIP WITH CAPTAIN'S EYE, TURNS YOUR VESSEL'S STANDARD CCTV CAMERAS INTO A POWERFUL, AI-DRIVEN SECURITY SYSTEM THAT DETECTS SAFETY BREACHES AND SECURITY THREATS IN REAL TIME - KEEPING YOU COVERED 24/7.

CUSTOMIZABLE TO EVERY SCENARIO

Set thresholds tailored to your vessel's unique safety and security needs - both onboard and along its perimeter - across all operational phases: docking, onboarding, loading, cruising, and more. Configure parameters based on time of day, voyage type, vessel layout, or known risk zones-whether on deck or at sea.

SMART ALERTS, SENT WHERE THEY MATTER

For each scenario, choose the type of alert you want and where it should be sent: onboard security, HRM command & control center, or ship management. Once configured, our AI engine continuously monitors all defined areas, detects breaches or threats in real time, and automatically alerts the designated parties, empowering them to act swiftly and effectively.

REAL-TIME SUPPORT IN YOUR HAND

Get instant assistance from your team or ours with our dedicated handheld device, enabling you to stream live video directly to offshore command or service experts. Whether troubleshooting complex issues, performing inspections, or coordinating with offshore staff, the device streamlines communication, accelerates resolutions, and minimizes operational downtime.

HOW IT WORKS

An on-premise server connects to CCTV cameras, generates real-time alerts based on your configurations, and securely transmits them - along with short video clips - to a cloud-based management server.

Beyond delivering alerts in near real time (depending on satellite connectivity), critical footage is accessible to relevant stakeholders for post-incident review or investigation.

The system is designed to function effectively even under low satellite bandwidth conditions.

EXAMPLES OF SAFETY ALERTS:

- Early smoke detection in machinery areas
- Oil, chemical, or water leakage
- Man-on-watch supervision gaps
- Incidents of person not moving, or person in distress
- Compliance with PPE requirements (such as wearing helmets and vests)
- Anomaly detection: identification of faulty hardware or incomplete tasks
- Compartment inspection routine compliance

EXAMPLES OF SECURITY ALERTS:

- Personnel onboarding and departing during docking
- Restricted zone violations
- Attempted stowaways or smuggling
